Twocorex Shadow GPU: The Magic Money Saver

Prepared by: TWOCOREX (OPC) PRIVATE LIMITED

---

1. What is it?

Imagine you have a giant toy room (your Cloud). Sometimes, you leave the lights on when you aren't playing. Sometimes, you rent a giant truck just to carry one small apple.

Shadow GPU is a **Magic Robot** that watches your toy room. It tells you: *"Hey! Turn off that light!"* and *"Use a smaller truck!"*

2. How does it work?

1. **The Watcher**: We put a tiny robot (Agent) on your computers.
2. **The Thinking**: The robot sits quietly and writes down everything that happens. It checks if the computers are working hard or just sleeping.
3. **The Report**: After 2 days, the robot gives us a **Story Book** (Audit Report).

3. How do we use it?

Step 1: The Sticker (Install)

We paste one magic sticker (Command) on your computer system.

> `helm install shadow-agent` *(This wakes up the robot.)*

Step 2: The Nap (Wait)

We go to sleep for 2 days. The robot stays awake and watches.

Step 3: The Treasure Map (Report)

We give you a paper that says:

- "You have **5 Sleeping Computers**."
- "If you turn them off, you find **$1,000**!"

Step 4: The Prize (Fix)

You accept the help, we turn off the sleeping computers, and you keep the money!
